# ECON 7201 Applied Econometrics Emmanuel

# Assignment 1

#### **Due Date**

September 18, 2025 at the start of class

#### **Directions**

Answer all questions. Submit both a PDF and Quarto file to the nexus assignment portal.

# 1. Git and GitHub

- (a) Create a GitHub repository called **econ\_3201** and connect it to RStudio.
- (b) Create a new R project in this newly created directory called **assignment\_1**. (Note, you do not have to click "Create git repository" as the directory is contained in a git enabled directory, i.e., **econ\_3201**).
- (c) Download the assignment PDF and Quarto file the **assignment 1** folder.
- (d) Commit and push the changes to your econ\_3201 repository on GitHub.com.

**Ans**. I have created the repository and pushed all the changes to my repository on github.com (https://github.com/Emmanuel-spec493/econ\_3201).

## 2. LaTeX

LaTeX is useful for writing math equations and presents them in a neat and orderly way. To write in math mode, wrap your text in \$ for inline text use two \$s for display (i.e., centered on the page). Some very useful functions include:

• Fractions:\frac{}{}, e.g.  $\frac{1}{2}$  gives  $\frac{1}{2}$  and  $\frac{1}{2}$  gives:

 $\frac{1}{2}$ 

• Subscripts: \_ gives a subscript, e.g.  $x_1$  gives  $x_1$ . To include more than one term in the subscript, the items in the subscript must be enclosed by {}. E.g.  $x_1$ , 1} gives  $x_1$ , (Note that  $x_1$ , 1\$ gives  $x_1$ , 1)

- Exponents:  $\hat{ }$ , e.g.  $x^2$  gives  $x^2$ .  $\hat{ }$  can also be used for superscripts in other math functions, including summations and integrals.
- Aligned: aligned neatly aligns multiple lines of an equation. Align is useful when writing multiple steps to solving an equation. To use it in Quarto, write \$\$\begin{aligned}...\end{aligned}. The & is used to mark the point where the lines should be aligned. Use \\ at the end of each line E.g. \$\$\begin{aligned}

gives

$$x = 3 + 5$$
$$= 8$$

- Summation: \sum gives the summation sign, i.e.  $\sum$ . To include subscripts, use \_ and to use superscripts use ^, e.g.  $\sum_{i=1}^n \$  gives  $\sum_{i=1}^n$ , which reads as the sum of i equals 1 to n.
- Integral: \int gives an integral, i.e. ∫. To place a lower limit use \_ and to place an upper limit, use ^, e.g. \$\int\_{a}^{b}\$\$ gives ∫<sub>a</sub><sup>b</sup>.
  Greek letters: \$\alpha, \beta, \gamma, \Gamma, \delta, \Delta, \epsilon,
- Greek letters: \$\alpha, \beta, \gamma, \Gamma, \delta, \Delta, \epsilon, \varepsilon, \zeta, \sigma, \Sigma, \theta, \vartheta, \Theta, \iota, \kappa, \lambda, \Lambda, \mu\$ gives  $\alpha, \beta, \gamma, \Gamma, \delta, \Delta, \epsilon, \varepsilon, \zeta, \eta, \sigma, \Sigma, \theta, \vartheta, \Theta, \iota, \kappa, \lambda, \Lambda, \mu$ . (See https://www.overleaf.com/learn/latex/List\_of\_Greek\_letters\_and\_math\_symbols)
- Accents:  $\hat{Y}$ ,  $\hat{Y}$ , and  $\hat{Y}$ , and  $\hat{Y}$ , and  $\hat{Y}$ , and  $\hat{Y}$ , respectively.
- Text: To include text in your equation, i.e. non italicized text, use text, e.g. x=2 if y=1 gives x=2 if y=1.
- Inequalities: Some mathematical expressions may be written as inequalities, rather than equations. For 'less than' and 'greater than', you can just use the symbol on your keyboard, i.e. < and >, respectively. For ≤, use \$\leq\$ and for ≥, use \$\geq\$. An important note is that after writing a command, put a space after the command before writing the next term, otherwise you may get an error. E.g. To write a ≤ b, write \$a\leq b\$, not \$a\leqb\$.

Re-write the following equations in LaTeX.

(a) 
$$E(Y) = y_1 p_1 + ... + y_k p_k = \sum_{i=1}^k y_i p_i$$

(b) 
$$\sigma_y = \text{Var}(\mathbf{Y}) = \mathbf{E}[(\mathbf{Y} - \mu_y)^2] = \sum_{i=1}^k (y_i - \mu_y)^2 p_i$$

(c) 
$$\hat{\beta} = \frac{\sum_{i=1}^{n} (y-y_i)(x-x_i)}{\sum_{i=1}^{n} (x-x_i)^2}$$

(d) 
$$P(a \le Y \le b) = \int_a^b fY(y) dy$$

(e) 
$$\hat{g}(\mathbf{x}) = \frac{\frac{1}{nh} \sum_{i=1}^{n} y_i k(\frac{x_i - x}{h})}{\frac{1}{nh} \sum_{i=1}^{n} k(\frac{x_i - x}{h})}$$

## 3. R

## 3.1. Assignment

Note: When creating variables based on equation, separate each element in the equation with the appropriate arithmetic symbol. E.g., to compute x(y-2) in R, you would have to type x\*(y-2). x(y-2), with not arithmetic symbol between x and the left bracket would result in an error.

(a) In statistics, n is often used to denoted the sample size. Set the number of observations n = 1000.

```
n <- 1000
```

(b) Generate two random variables,  $u_1 \sim U(0,1)$  and  $u_2 \sim U(0,1)$  with n/2 = 500 observations. That is, create two variables that follow a uniform distribution between 0 and 1 that each have 500 observations. In R, we can create random uniform variables using the runif(k,min,max) function, where k is number of observations, min is the minimum value, and max is the maximum value. The default values for min and max are 0 and 1, respectively. Type ?runif into your console to learn more.

```
k <- n/2

u1 <- runif(k, min = 0, max = 1)

u2 <- runif(k, min = 0, max = 1)
```

(c) Generate two variables  $z_1$  and  $z_2$  that take on the following values:

$$z_1 = \sqrt{-2\ln(u_1)} \times \cos(2\pi u_2)$$

and

$$z_1 = \sqrt{-2\ln(u_1)} \times \sin(2\pi u_2).$$

In R,  $\sqrt{\ }$  is computed using sqrt(), ln is computed using log(), cos is computed using cos(), and sin is computed using sin().

```
z1 <- sqrt(-2*log(u1))*cos(2*pi*u2)

z2 <- sqrt(-2*log(u1))*sin(2*pi*u2)
```

(d) Generate a vector  $z = [z_1, z_2]$ 

```
z <- c(z1, z2)
```

(e) Generate two variables  $\mu$  (spelled mu) and  $\sigma$  (spelled sigma). Set  $\mu = 5$  and  $\sigma = 2$ .

```
mu <- 5
sigma <- 2
```

(f) Generate a variable  $x = \mu + \sigma \times z$ 

```
x <- mu + sigma * z
```

(g) Calculate the mean of x, using mean() and the standard deviation of x using sd()

```
mean(x)
```

[1] 5.040638

```
sd(x)
```

- [1] 2.056363
- . (h) Use the following code to plot a histogram of x with the normal distribution curve.

```
hist(x,freq = FALSE,ylab = "Density", xlab = "$x$")
curve(dnorm(x, mean = mu , sd = sigma ), col = "red" , lwd = 2 , add = TRUE)
```

# Histogram of x

```
hist(x,
    freq = FALSE,
    ylab = "Density",
    xlab = "$x$")

curve(dnorm(x, mean = mu, sd = sigma),
    col = "red", lwd = 2, add = TRUE)
```

## 3.2. Data frames and Indexing

A data frame in R is a table-like data structure used to store data in rows and columns, similar to a spreadsheet or a database table. It is one of the most commonly used structures for storing datasets in R.

Table 1 displays the total health expenditure by use of funds in Canada from 1975 to 2022. The data is stored in the data.frame called df.

Table 1: Total health expenditure by use of funds, in millions of current dollars, Canada, 1975 to 2022 (Source: CIHI National Health Expenditure Trends)

 df <- (read.csv("hlthexp.csv"))</pre>
```

#### any(is.na(df\$Hospitals))

#### [1] FALSE

(b) Add a variable called "Total Other Services" to the data frame df, where

Total Other Services = Dental + Vision + Other Professional.

To add a newly created variable to a data frame use the syntax dataframe\$varname <-expression.

```
df$TotalOtherServices <- df$"Other.Professionals..Dental.Services" +
df$"Other.Professionals..Vision.Care.Services" + df$"Total.Other.Professionals"</pre>
```

- (a) Are there any years for which Total Other Professionals
- (b) Another way to add a variable to a data frame is to simply create a new data frame and append the new variable to it. Note: we can use the same data frame name. I.e., df<-data.frame(df,newvarname = newvar). Add the variable "Prescription Drugs" to the df data frame using the append method, where presricption drugs is named "Prescribed.Drugs" in the cihi data.frame.

```
df <- data.frame(df, Prescription.Drugs = df$Prescribed.Drugs)</pre>
```

(a) Using a single R command, determine the expenditure on hospitals in 1983.

```
df$Hospitals[df$Year == 1983]
```

#### [1] 13174.55

(a) Using a singe R command, list the expenditures by year for 2012-2022.

```
df[df$Year %in% 2012:2022, ]
```

	Year	${\tt Hospitals}$	${\tt Other.Institutions}$	Physicians

#### 3.3 Other useful R commands.

Load the mpg dataset from the ggplot2 package using mpg <-ggplot2::mpg. (Be sure to install the gglot2 package before you start.)

```
library(ggplot2)
mpg <- ggplot2 ::mpg</pre>
```

Subset the data to include only observations from 2008. Search ?subset in the console.

```
mpg_2008 <- subset(mpg, year == 2008)</pre>
```

(a) Calculate the maximum and minimum miles per gallon in city limits (cty). Seach ?min in the console.

```
min(mpg_2008$cty, na.rm = TRUE)
```

[1] 9

```
max(mpg_2008$cty, na.rm = TRUE)
```

[1] 28

(b) Estimate the average miles per gallon within city limits for cars produced in 2008 using the formula

Average mpg = 
$$\frac{\sum_{i=1}^{n} \operatorname{cty}_{i}}{n}.$$

Recall that n is the number of observations. Search ?length in the console.

```
sum(mpg_2008$cty) / length(mpg_2008$cty)
```

[1] 16.70085

(c) Estimate the average miles per gallon within city limits for cars produced in 2008 using the mean() function.

```
mean(mpg_2008$cty)
```

## [1] 16.70085

(d) Create a variable called compact, which takes a value of 1 if the vehichle is a compact and 0 otherwise. Search ?ifelse in the console.

```
library(ggplot2)
df <- mpg
df_2008 <- subset(df, year == 2008)
df$compact <- ifelse(df$class == "compact", 1, 0)</pre>
```

(e) Estimate the average miles per gallon within city limits for compact cars. (You may use whichever method you prefer).

```
mean(df$compact)
```

#### [1] 0.2008547

(f) Create a simple scatter plot with city mpg (cty) on the x-axis and highway mpg (hwy) on the y-axis. Search ?plot and choose "Generic X-Y Plotting".

```
plot(df_2008\$cty, df_2008\$hwy, xlab = "city mpg (cty)", ylab = "highway mpg (hwy)", col = "labeled to the state of the s
```

(i) Change the x-axis label using the option `xlab = "City MPG"` and change the y-axis label plot(df\_2008\$cty, df\_2008\$hwy, xlab = "City MPG (cty)" , ylab = "Highway MPG (hwy)" , col =

(ii) Add the caption "City Versus Highway Fuel Efficiency (MPG)"

```
plot(df_2008$cty, df_2008$hwy,
    xlab = "City MPG (cty)",
    ylab = "Highway MPG (hwy)",
    main = "City versus Highway fuel Efficiency (MPG)", ,col = "blue")
```

# City versus Highway fuel Efficiency (MPG)

(iii) Cross reference the figure and add the text "Figure 1 shows the fuel efficiency for ci

```
plot(df_2008$cty, df_2008$hwy,
    xlab = "City MPG (cty)",
    ylab = "Highway MPG (hwy)",
    main = "City versus Highway fuel Efficiency (MPG)" , col = "blue")
```

# City versus Highway fuel Efficiency (MPG)

# **City versus Highway Fuel Efficiency (MPG)**

Figure 1 Shows the Fuel Efficiency for City Driving versus Highway Driving
